## Features of the Cubro Bypass TAP

• Available as electrical or optical design

- Can be used as passive TAP or Bypass Switch
- Trigger options:
  - Ping (ICMP)
  - Rest API
  - GPIO pins
  - Front panel button
  - Power loss
- Graphical throughput statistics
- Intuitive Web UI for management
- SNMPv2 support
- Dual power supply

![](_page_4_Picture_13.jpeg)

![](_page_5_Picture_0.jpeg)

![](_page_5_Picture_1.jpeg)

![](_page_6_Picture_0.jpeg)

The Cubro Bypass TAP can work standalone, but also in combination with a Cubro Packetmaster.

Cubro Packetmasters have the ability to work as a bypass device with heartbeat functionality, on any port at any port speed.

The advantage of combining the Bypass TAP and a Packetmaster is to bypass multiple links that are connected to one sensitive device, for example a firewall.

This modular concept reduces cost and offers a lot of flexibility.

@Cubro Confidential

# Cubro Copper Bypass Concept standalone

This is the simplest solution to use the Cubro Copper Bypass.

### The inline tool is protected by Bypass tap **(without heartbeat)**

The Bypass link activation works with

- Ping (ICMP)
- Rest API
- GPIO pins
- Front panel button
- Power loss
- Bandwidth change

![](_page_8_Figure_10.jpeg)

![](_page_8_Picture_11.jpeg)

![](_page_9_Picture_0.jpeg)

![](_page_10_Picture_2.jpeg)

(10/100/1000 Mbit/s) classical tap device.

![](_page_11_Picture_0.jpeg)

![](_page_11_Picture_1.jpeg)

![](_page_12_Picture_0.jpeg)

After connecting to the Cubro Bypass TAP, the Web UI shows the current status of the Bypass TAP. This includes CPU / RAM usage, temperature, fan speed and the current mode of the Bypass TAP.

These values refresh every 5 seconds automatically.

![](_page_12_Picture_3.jpeg)

![](_page_12_Picture_4.jpeg)

![](_page_13_Picture_0.jpeg)

Navigate to "Bypass Mode Config" via the top menu to access the configuration panel for the Bypass Mode. The Bypass supports up to 3 different modes which are explained in the next few slides.

Cubro Bypass Tap	Bypass Mode	e Config Ports 👻	
	Mode	e Config	
	Mode sel	election	
	Mode	Тар	
		Bypass	-
		Patch Panel	

![](_page_13_Picture_3.jpeg)

![](_page_14_Picture_0.jpeg)

The Bypass TAP works as a 1 link Bypass switch.

When power is lost, the Bypass TAP will always switch to Bypass mode.

![](_page_14_Figure_3.jpeg)

SIMPLE

| SCALABLE | SUSTAINABLE

#### Confidential @Cubro

![](_page_15_Picture_0.jpeg)

The Bypass TAP can be controlled via ICMP protocol (ping).

#### Concept:

The Bypass TAP sends continuous ping requests to an external device.

As long as the external device responds to those pings the Bypass TAP will stay in Throughput mode. When the ping fails the Bypass TAP switches to Bypass mode as long as the external device does not answer the ping requests.

- Ping target: The IP address of the external device

Bypass Settings	
Trigger Ping	
Ping target 192.168.0.144	
Submit	
	@Cubro Confidential

![](_page_15_Picture_7.jpeg)

![](_page_16_Picture_0.jpeg)

The Bypass TAP can be controlled via the REST API of the Bypass TAP and Cubro Packetmaster.

#### Concept:

17

A Cubro Packetmaster of Generation 2 to 4 can control the Bypass TAP via the installed Bypass App. To allow this application, the trigger needs to be set to "REST".

- Timeout: After x seconds the Bypass TAP engages the bypass mode when the Cubro Packetmaster is not reachable.

Bypass Sett	ings				
Trigger	REST				
Timeout	0.1 seconds				
	Submit				
		@Cubro	Confidential		

### Bypass Mode - REST - 3rd party

The REST API of the Bypass TAP can also be used by any 3rd party device to trigger the bypass mode whenever it is required.

#### Concept:

An application which is bypassed using the Cubro Bypass TAP is connected to the same IP network like the before named Bypass. The application can use the REST API to take control over the Bypass and switch into Bypass mode when service x fails or crashes.

![](_page_17_Picture_4.jpeg)

![](_page_17_Picture_5.jpeg)

![](_page_18_Picture_0.jpeg)

The Bypass TAP can be controlled via the GPIO pins on the front panel.

#### Concept:

Using the four GPIO pins on the front panel also allows triggering of the bypass mode when the specific selected requirements are met.

Bypass Set	ttings				
Trigger	GPIO				
Bypass d	levice if	Pin 1 and 2 are shorted	\$ AND \$	Pin 3 and 4 are shorted	\$
	Submit				

![](_page_18_Picture_5.jpeg)

![](_page_19_Picture_0.jpeg)

The Bypass TAP works as a common 1 link passive TAP.

- POWER ON:
  - The link connected via the "link ports" is UP
  - The ingress traffic is mirrored to the "device ports".

![](_page_19_Figure_5.jpeg)

- The link connected via the "link ports" is UP
- No traffic mirroring during power off.
- The monitoring ports connected to "device ports" are DOWN

![](_page_19_Figure_9.jpeg)

![](_page_19_Figure_10.jpeg)

![](_page_19_Picture_11.jpeg)

![](_page_20_Picture_0.jpeg)

The Bypass TAP works as a 4 port patch panel with many combinations.

Each network port can work as an egress interface for one ingress interface. This means that the patch panel mode allows aggregation (many to one) but no traffic duplication (one to many / many to many).

Mode Confia

The patch panel mode always requires power.

When losing power the Bypass TAP will always switch to Bypass mode (Port 1  $\leftrightarrow$  Port 2).

Mode	Patch Panel		•
mode	T dtorr droi		
tab D	anal Cattings		
itch P	anei Settings		
Port	2	¢	$\rightarrow$ Port 1

Dort Config

![](_page_23_Picture_0.jpeg)

The Bypass TAP support SNMPv2 per default.

This allows sending SNMP traps to a target host and to pull system information via SNMP GET or WALK.

A trap is sent to the defined host when

- Any physical port changes to status "down"
- Any physical port changes to status "up"
- Bypass mode is engaged
- Bypass mode is disengaged

# 1 Link Bypass TAP - standalone

#### The application:

The Bypass TAP is connected to 2 network devices via the Link ports and to a 3rd party server via the device ports.

The trigger of the Bypass TAP is set to PING and it sends continuous ping requests to the server.

As soon as the server stops responding the pings the Bypass TAP will engage the bypass mode. When the server starts responding again the Bypass TAP switches back to the throughput mode.

This application works only via ICMP (ping). No heartbeat packets are used to monitor the connectivity between the server and the Bypass TAP.

![](_page_25_Figure_6.jpeg)

![](_page_25_Picture_7.jpeg)

## EX2 + Bypass TAP - Normal status

#### The application:

The Bypass TAP is connected to 2 network devices via the Link ports and to a Cubro Packetmaster EX2 via the device ports. A 3rd party server is connected to the EX2 via 2 x 1G copper. The Packetmaster EX2 sends heartbeat packets to the server via port #1 and expects to receive them again on port #2.

The trigger of the Bypass TAP is set to REST and the EX2 runs the Bypass App.

Traffic flow in throughput mode:

Device 1  $\leftrightarrow$  Bypass TAP  $\leftrightarrow$  EX2  $\leftrightarrow$  Server  $\leftrightarrow$  EX2  $\leftrightarrow$  Bypass TAP  $\leftrightarrow$  Device 2

![](_page_26_Figure_6.jpeg)

![](_page_26_Picture_7.jpeg)

### EX2 + Bypass TAP - Software Bypass

#### Software Bypass explained:

In the case the heartbeat packets are not detected by the EX2, it will engage the software bypass.

The configuration of the EX2 automatically changes to send the incoming traffic back to bypass TAP which reinserts the traffic back into the live link with minimal packet loss.

The Bypass TAP does not need to react at all because all bypassing is done by the EX2.

Traffic flow during software bypass: **Device 1** ↔ **Bypass TAP** ↔ **EX2** ↔ **Bypass TAP** ↔ **Device 2** 

![](_page_27_Figure_6.jpeg)

![](_page_27_Picture_7.jpeg)

# EX2 + Bypass TAP - Hardware Bypass

#### Hardware Bypass explained:

In the case that the EX2 fails or a connection between the Bypass TAP and the EX2 goes down, the Bypass TAP will switch to bypass mode to keep the live link up.

When the Bypass TAP engages the bypass mode, the EX2 and the external server will be bypassed and do not receive any traffic until the Bypass TAP switches back to throughput mode.

Bypass mode is also triggered when the Bypass TAP no longer receives power.

Traffic flow during hardware bypass: **Device 1**  $\leftrightarrow$  **Bypass TAP**  $\leftrightarrow$  **Device 2** 

![](_page_28_Figure_6.jpeg)

![](_page_28_Picture_7.jpeg)

![](_page_29_Picture_0.jpeg)

#### Setup explained:

In this setup, one copper link of 2 devices connected to a certain server is bypassed via 2 x Cubro Copper Bypass TAP. The advantages compared to the 1 Bypass solution is, that when the connection to the Packetmaster is disturbed the server is still part of the live link.

![](_page_29_Figure_3.jpeg)

![](_page_29_Picture_4.jpeg)

![](_page_30_Picture_0.jpeg)

#### Software Bypass explained:

In the case the heartbeat packets are not detected by the EX5-2, it will engage the software bypass.

The Bypass TAPs do not need to react at all because all bypassing is done by the EX5-2.

Traffic flow during software bypass:

Device 1  $\leftrightarrow$  Bypass TAP1  $\leftrightarrow$  EX5-2  $\leftrightarrow$  Bypass TAP2  $\leftrightarrow$  Device 2

![](_page_30_Figure_6.jpeg)

![](_page_30_Picture_7.jpeg)

![](_page_31_Picture_0.jpeg)

#### Hardware Bypass explained:

In the case that the EX5-2 fails or a connection between the Bypass TAPs and the EX5-2 goes down, both Bypass TAPs will switch to bypass mode to keep the live link up. Compared to the "1 Bypass per Link" setup, the Server is still included to the live link.

Device 1  $\leftrightarrow$  Bypass TAP1  $\leftrightarrow$  Server  $\leftrightarrow$  Bypass TAP2  $\leftrightarrow$  Device 2

![](_page_31_Figure_4.jpeg)

![](_page_32_Picture_0.jpeg)

#### Setup explained:

Optional: Instead of one Packetmaster EX5-2, two Packetmaster EX2 can be used for interconnecting two different sites via a GRE tunnel. In the case that the server connecting both sites fails, the Cubro solution will bypass the server and the traffic can be distributed via the GRE tunnel of the Packetmaster EX2.
